#### Fabric Capacities Introduction

#### Single...

Onboarding and trials Sign-on Navigation model UX model Workspace organization Collaboration experience Data Lake Storage format Data copy for all engines Security model CI/CD Monitoring hub Governance & Capacity Metrics Data Hub

#### Capacities are a shared resource

#### Shared across workloads

A single capacity is providing the compute power for all Fabric workloads.

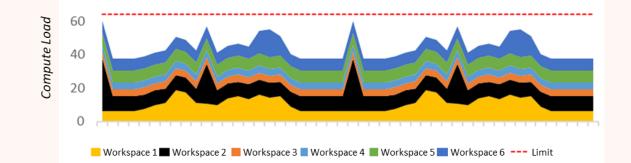

There is no need to allocate compute for each workload separately.

#### **Shared Across Projects**

A single capacity typically supports dozens of separate projects simultaneously, each managed in its own workspace.

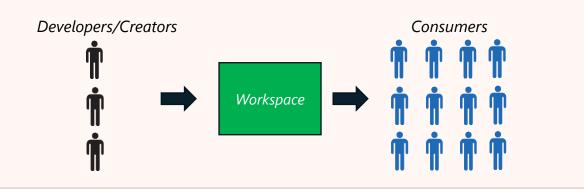

It is rare to have a capacity dedicated to a single project

#### Shared across users

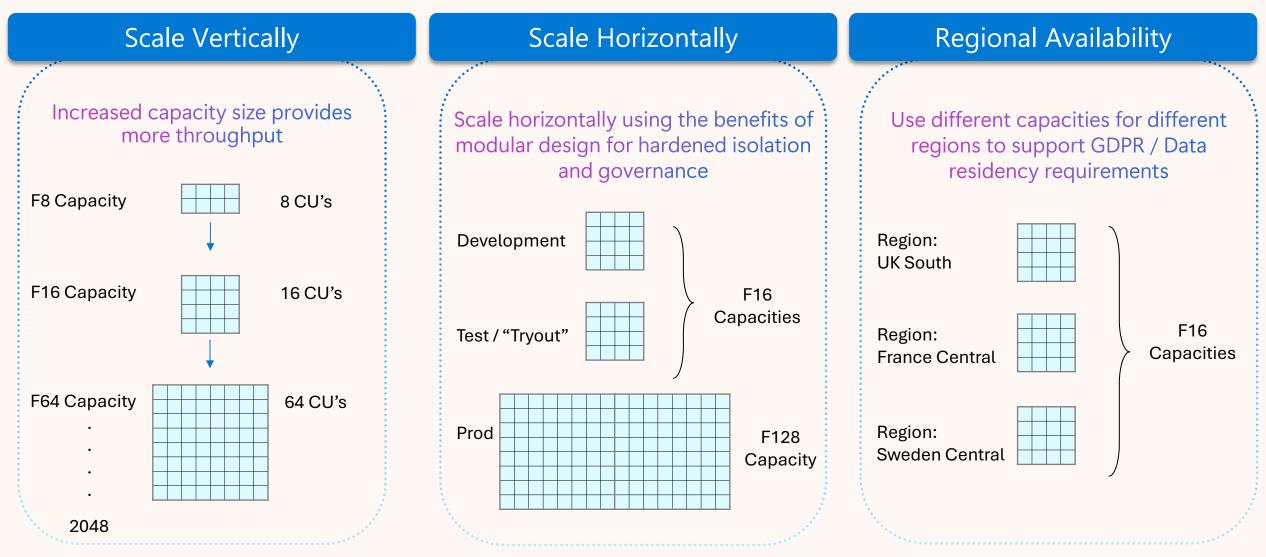

For each project, many developers will share a workspace where collaborative development and consumption at scale is managed.

Each creator can provision any artifact and run any job without the need for any pre-approval or planning

### Capacities are flexible building blocks for growth

Capacities can be configured in endless ways to meet scale, usage and governance requirements while tuning to minimize TCO and performance goals

#### Provisioning and Deploying Capacities

#### Purchased in Azure

- **Purchased** either as a PAYG or RI resource
- Provisioned with a certain amount of compute units, analogous to CPU cores.
- The more capacity units are provisioned, the more load the capacity can support
  - Multiply SKU size by 30s to match platform evaluation in metrics app
- Capacities are priced at a fixed hourly rate, based on capacity units provisioned
- The RI commitment (1-year reserved instance) enjoys a **41% discount**

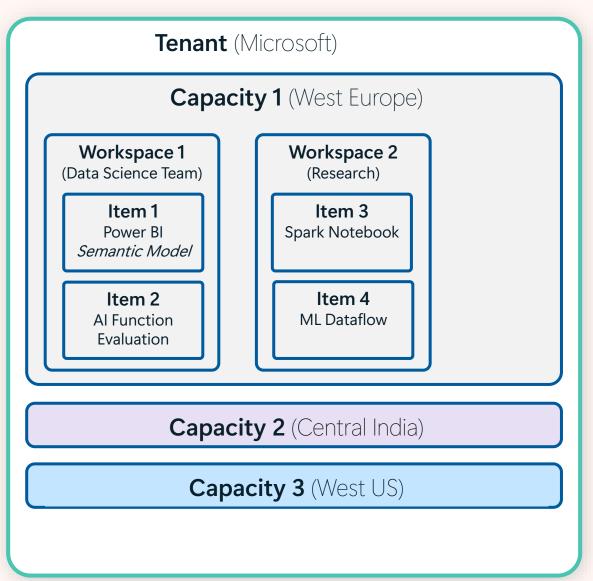

#### Universal Compute Capacities SKU Sizing

SKU	Capacity Units (CU)	CU's (per 30s)	Power Bl SKU	Power Bl V-cores
F2	2	60	-	0.25
F4	4	120	-	0.5
F8	8	240	A1	1
F16	16	480	A2	2
F32	32	960	A3	4
F64	64	1920	P1	8
F128	128	3840	P2	16
F256	256	7680	P3	32
F512	512	15360	P4	64
F1024	1024	30720	P5	128
F2048	2048	61440	-	256

#### Provisioning and Deploying Capacities

#### Deployed to Regions

- Each capacity **resides in a specific region of the buyers' choice** where both the data & compute reside
- Workspaces are assigned to a capacity that provides the compute and storage for all the workspace artifacts
- Multiple capacities can be purchased, deployed and managed by different owners residing in a single tenant allowing each business unit to pay for their own consumption

### Bursting and Smoothing

### Smoothing intro and benefits

Load stabilization	Smoothing helps capacities self-stabilize by flattening large spikey loads into a smooth load profile, eliminating temporal spikes	
	Large/scheduled Jobs usage (not execution) are	
Eliminates Scheduling contention	smoothed over 24 hours, eliminating the need to decide the timing and order of job execution	
Surge protection	Interactive operations smoothed over several minutes, preventing a single user with a very demanding query from hogging the entire capacity	

### What is Bursting?

#### Job acceleration

Bursting provides extra compute resources to jobs and queries to accelerate their completion Go beyond

The extra resources of bursting allow jobs to **utilize far more resources than "face value"** 

Instead of running a job on 64 CU and completing in 60 seconds, bursting could use 256 CUs to complete the job in 15 seconds.

Same amount of work, just completed faster

#### No hassle, No overload

**Bursting is automatic** when the system reasons it can accelerate the job by applying extra resources. No settings are required.

#### Bursting prevents an overload

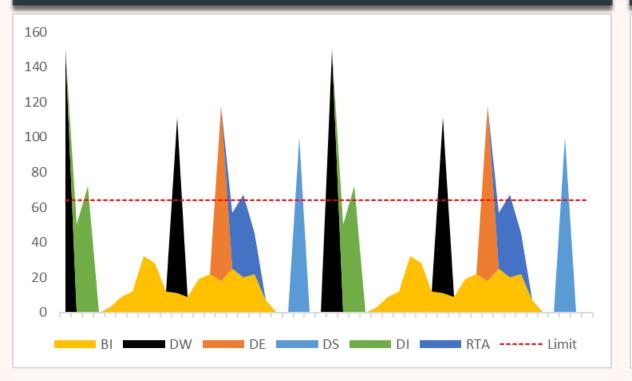

as the *smoothing* mechanism will always flatten the resource burst

### Bursting and smoothing | before and after

Looking at an example of a 64 CU capacity, running multiple workloads over a couple of days...

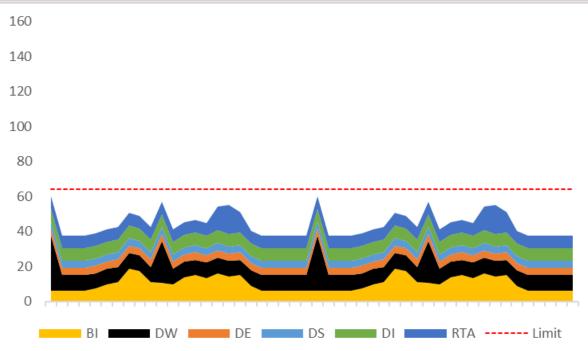

#### **Before Smoothing**

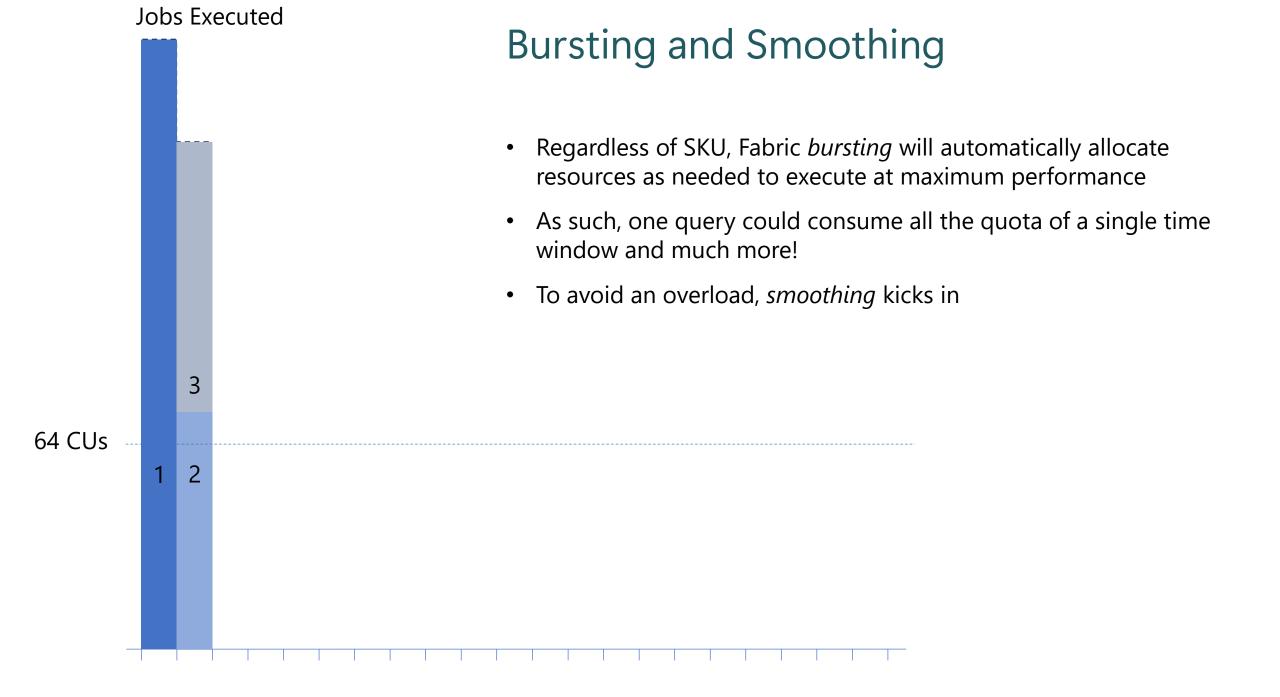

- <u>Actual</u> load as executed on the capacity before smoothing
- *Bursting* accelerates jobs execution by resource boosting
- The capacity could be overloaded 25% of the time
- Some of the overloads are more than 2x the limit
- There are periods of no/low usage

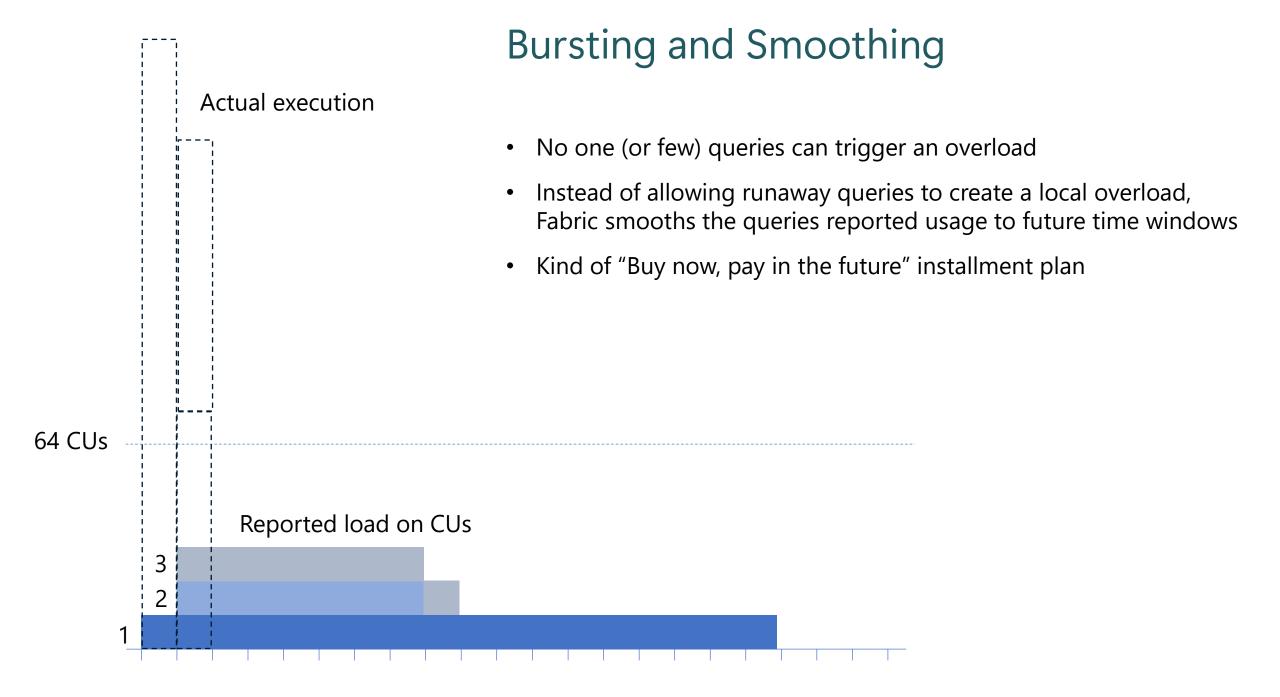

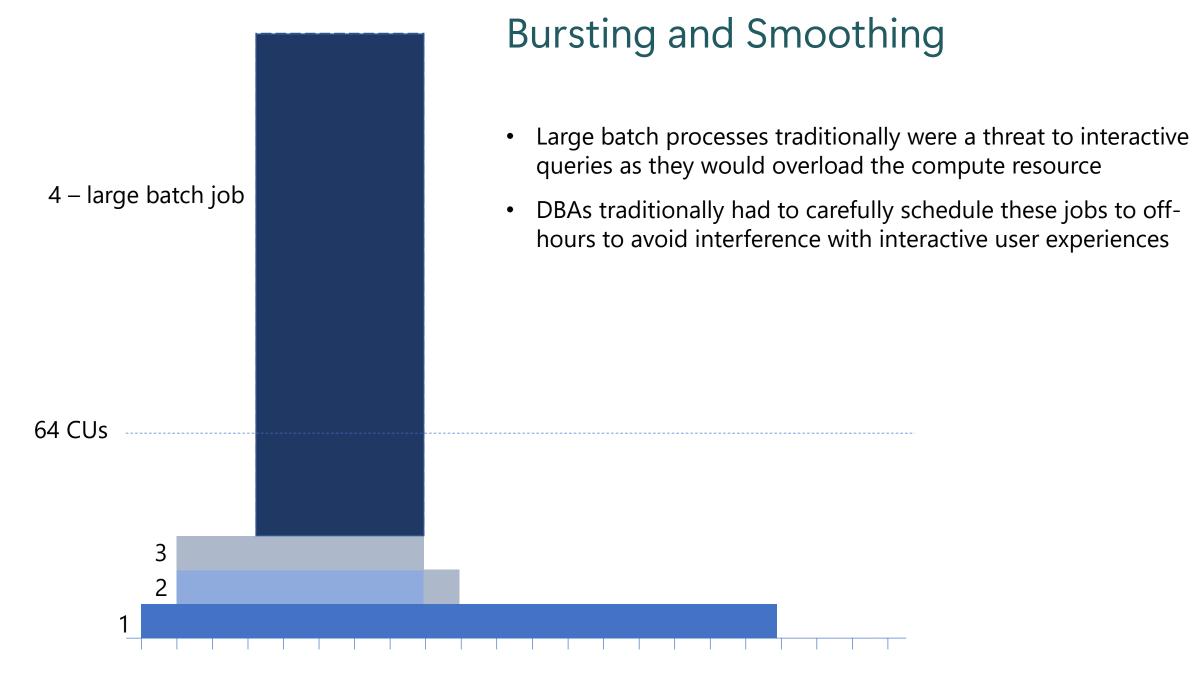

#### After Smoothing

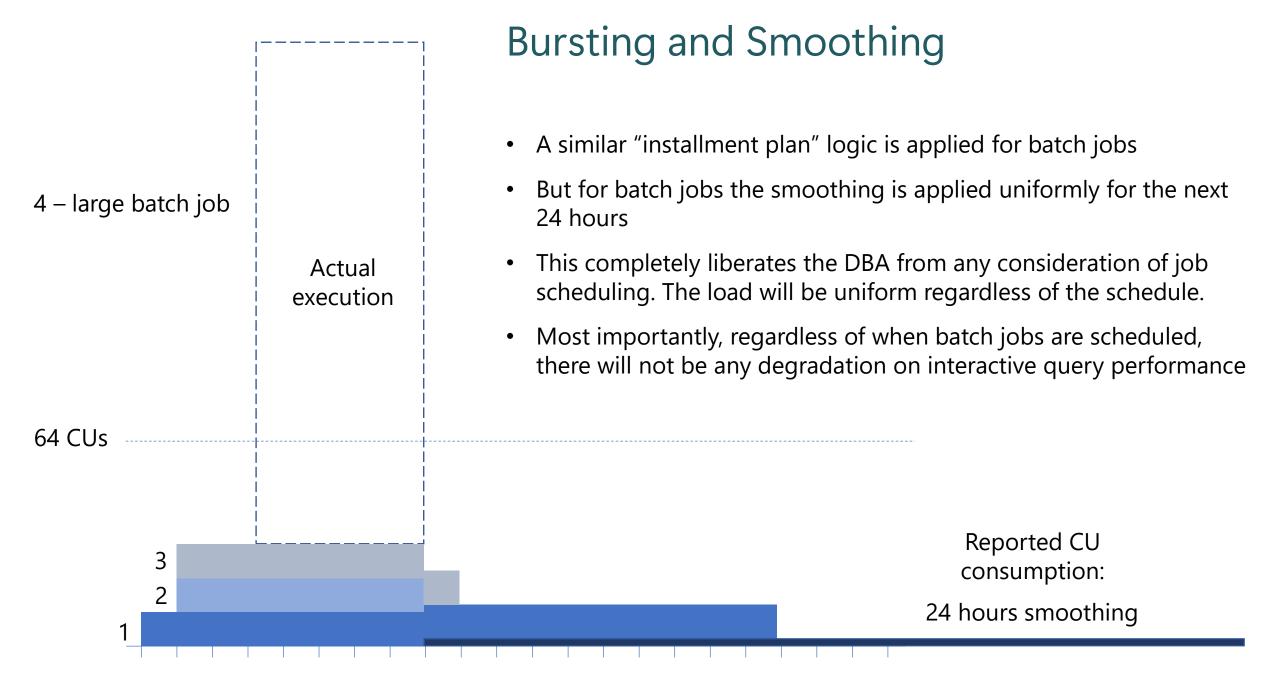

- Shows the reported load (not runtime execution) against the capacity limits
- There is NO overload, and consumption is more stable
- The smoothing of usage fills in gaps

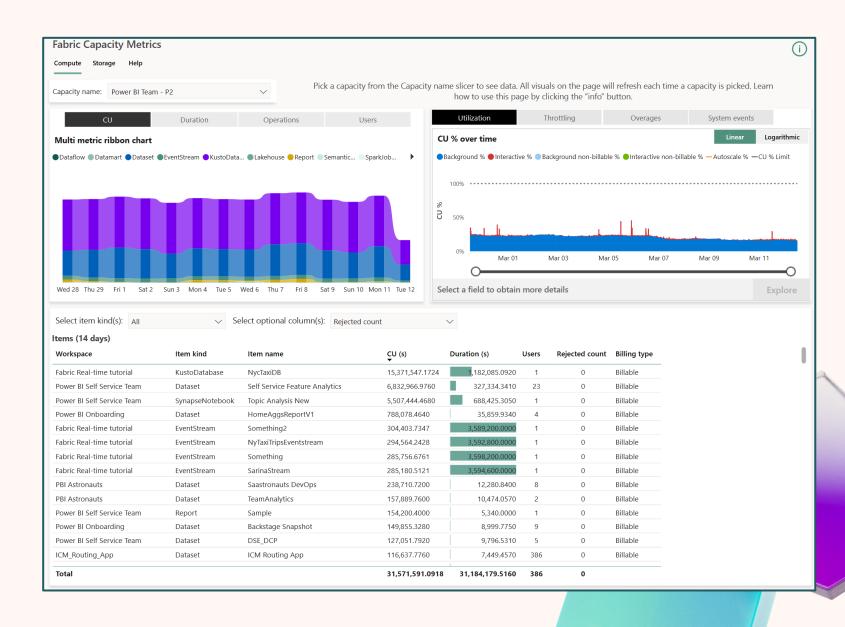

### Monitoring with Capacity Metrics

### **Capacity Metrics**

#### Monitor Capacities and Plan capacity scale-up with confidence

- Tenant wide visibility into capacity usage for all Fabric experiences
- Identify resource usage trends and their impact to autoscale & throttling
- View preview workload usage alongside production workloads to make data-driven capacity sizing decisions

### **Capacity Metrics**

# Monitor OneLake consumption

#### Measure the trends of workspace storage consumption against capacity limits, by day or hour

#### Reconcile costs with internal chargeback processes

### Capacity Throttling Policies

### Throttling intro

- Throttling is the platform policy for managing consumption that exceeds throughput is provided by SKU choice
- When workloads exceed the throughput of a capacity a cumulative debt is tracked to be burned down
- Cumulative debt is used to determine throttling policies and is burned down when resources are free

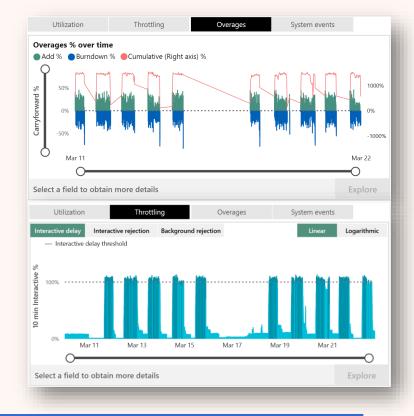

Overage Operation	Description
Overages - Added	<ul> <li>Timepoint when job requests exceed the throughput of a capacity, overages are was added to the cumulative buffer to burn down.</li> <li>This graph simplifies identification of the optimal timepoint to load timepoint drill to analyze the user operations that contributed to an overage.</li> </ul>
Overages - Burndown	Overages being reconciled when future capacity is free to burn down
Overages - Cumulative	<ul> <li>The total amount of queued work on the capacity to be burned down in the future when the capacity is not fully utilized</li> </ul>

### Capacity throttling evolution for Fabric

- For Fabric, throttling policies were refined to deliver multiple benefits
  - **Reduced throttling** for capacities that only experience occasional spikes
  - Added overage protection rejection policies prevent overloaded capacities from irrecoverable overload
  - **Optimizations for long-running jobs:** We're optimizing the platform for long-running jobs, so if a job exceeds capacity limits, it will run to completion and the overage will be burned down against future capacity

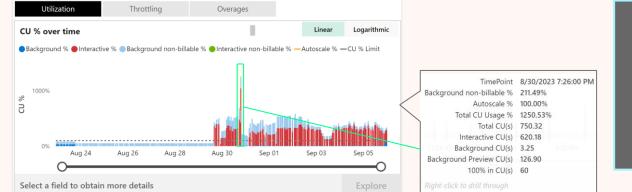

Smoothed Capacity - Future Use	Platform Policy	Customer Impact
<= 10m	Overage Protection	Jobs can consume 10 minutes of future capacity use without throttling
> 10m → <= 60m	Interactive Delay	User requested interactive type jobs will be throttled
> 60m → <= 24h	Interactive Rejection	User requested interactive type jobs will be rejected
> 24h	Background Rejection	User Scheduled background jobs will be rejected from execution

### Capacity Planning with Capacity Metrics

#### Capacity planning case study - measurement

Start with a test or trial capacity to evaluate the load of specific Fabric Experiences i.e., Power BI Datasets, Spark Notebooks or a Datawarehouse

If usage is above the current capacity limits , choose the desired utilization rate to accommodate via capacity scale up

Fabric Capacity Metrics											(i) 🤅

#### Load Capacity Metrics timepoint drill to analyze :

- Total CU's consumed : 749 CU(s)
- Capacity Size : (F2)
- CU(s) available on your capacity : 60 CU(s)

#### Capacity planning case study – SKU selection

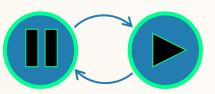

To accommodate a 749 CU(s) load the admin can purchase an F32 capacity providing 960 CU(s) of throughput

#### Universal Compute Capacities SKU Sizing

	SKU	Capacity Units (CU)	CU's (per 30s)	Power Bl SKU	Power Bl V-cores
	F2	2	60	-	0.25
	F4	4	120	-	0.5
	F8	8	240	A1	1
	F16	16	480	A2	2
$\neg$	F32	32	960	A3	4
	F64	64	1920	P1	8
	F128	128	3840	P2	16
	F256	256	7680	Р3	32
	F512	512	15360	P4	64
	F1024	1024	30720	P5	128
	F2048	2048	61440	-	256

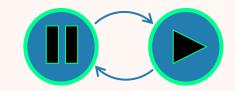

### Pausing and Resuming Capacities

### Pausing and Resuming Capacities

Why pause capacities?

1) It helps manage compute costs.

2) It clears any debt that has accumulated. Use it to quickly resolve throttling.

What does it do?

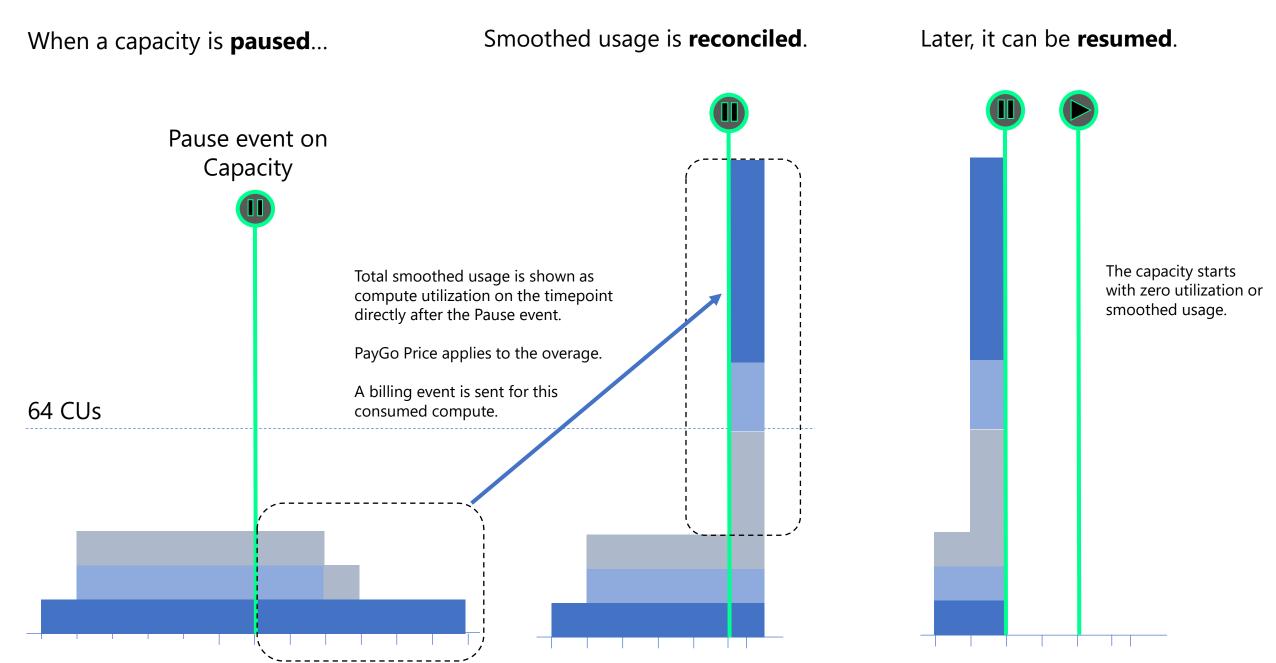

Workloads stop execution within 10 minutes of Pause action

New requests are not allowed to Start Smoothed usage will be reconciled

Note: OneLake storage costs continue to be billed while a capacity is paused

#### **How Capacity Pause & Resume works**

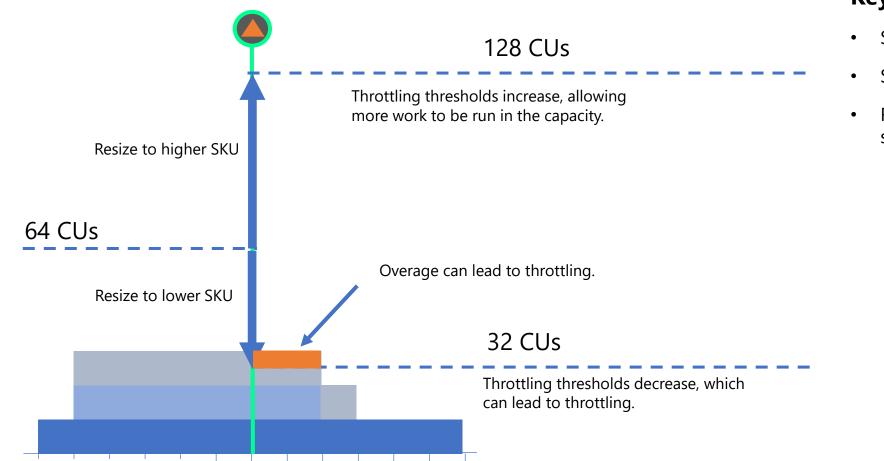

#### How Capacity Resize works

SKU Change

When a capacity is **resized**...

The allowed CUs per timepoint increase or decrease.

This changes the throttling allowed limits based on the new SKU's CUs and the throttling windows.

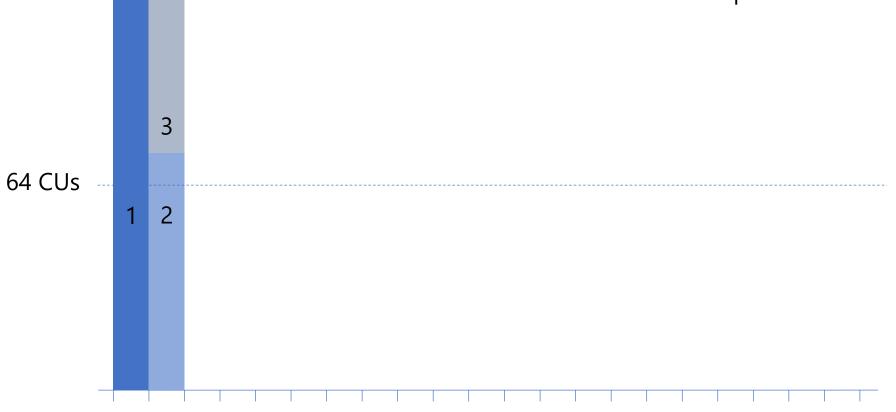

#### **Key Insights**

- Sizing up will incur the cost of the new SKU
- Sizing down could lead to more throttling
- Review your Throttling Thresholds before sizing down your SKU.

### Bursting and Smoothing

#### Jobs Executed

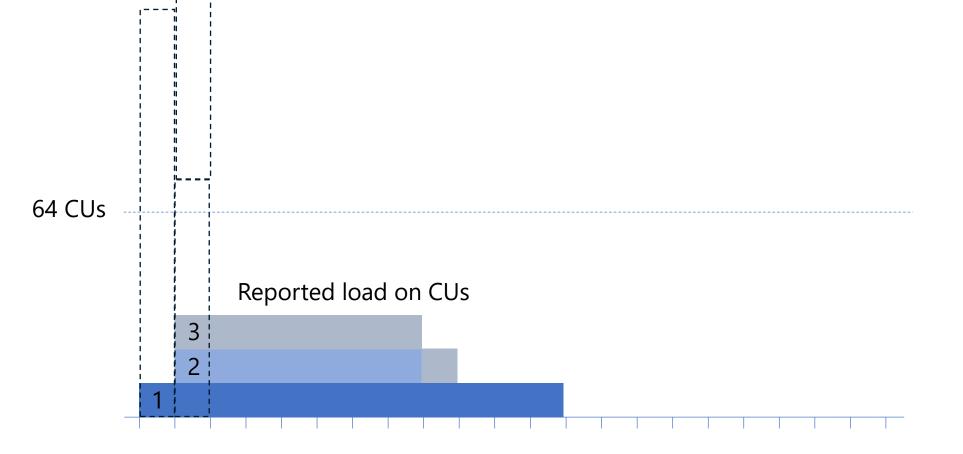

- Job execution in Fabric workloads happens on-demand via capacity powered compute engines
- Fabric *bursting* will automatically allocate resources as needed to execute at maximum performance

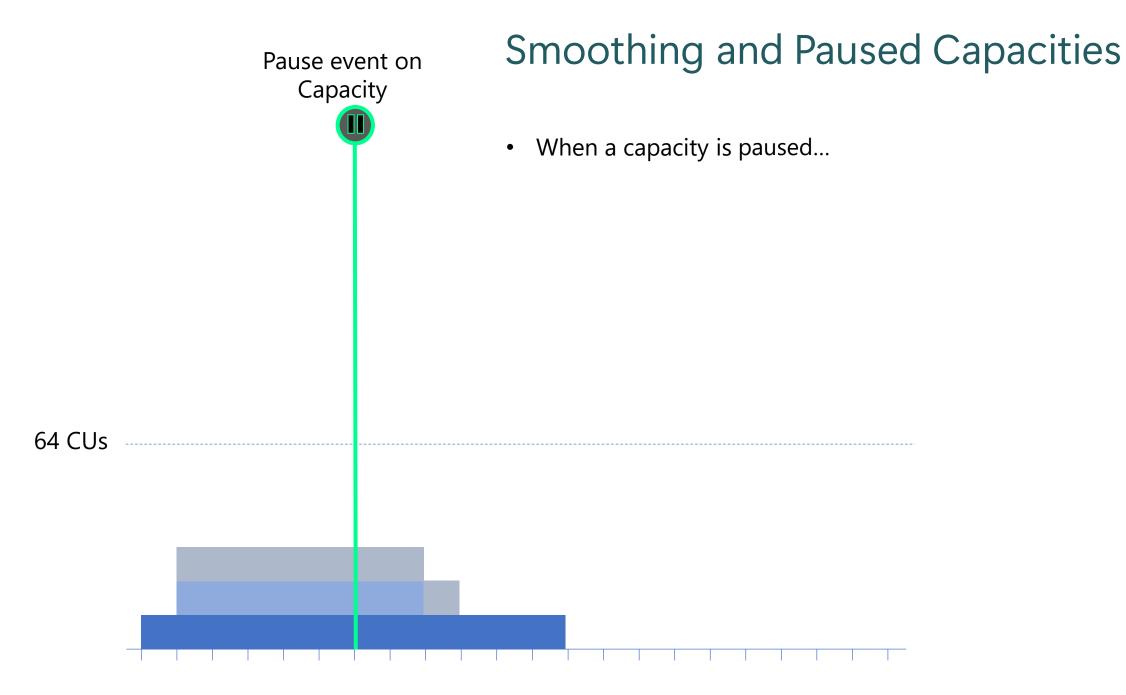

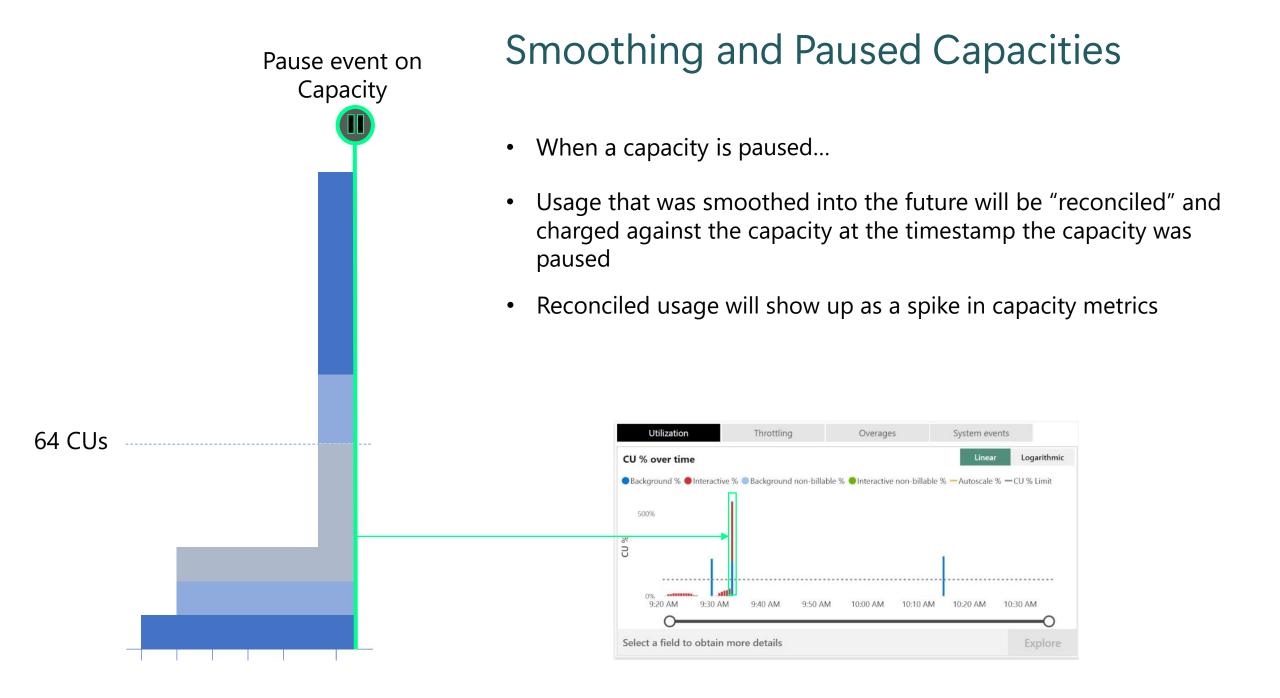

Actual execution

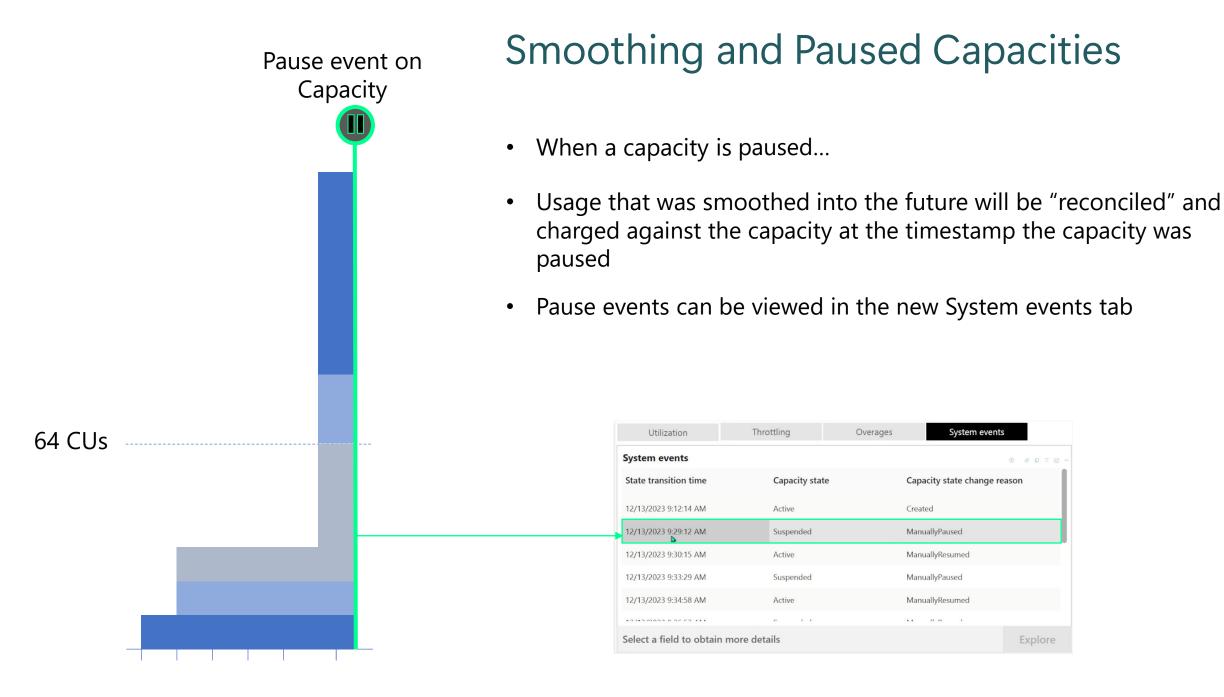

### **Bursting and Smoothing**

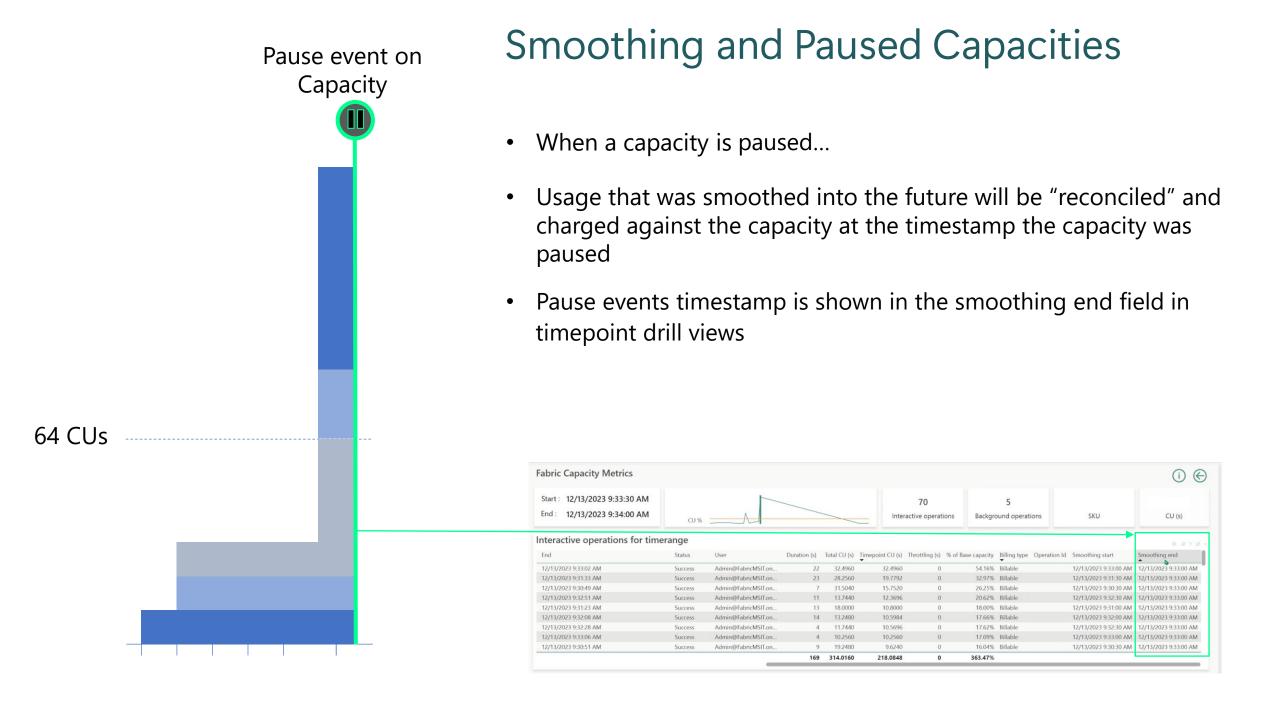

• The Fabric capacity platform *smooths* usage out to reduce throttling which can occur when demand exceeds the throughput of the capacity that was purchased

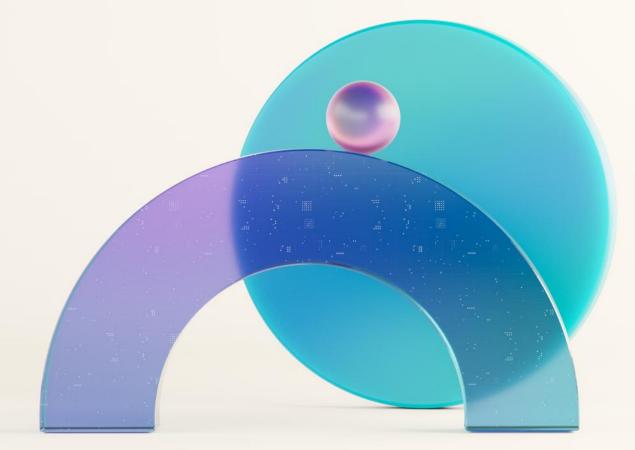

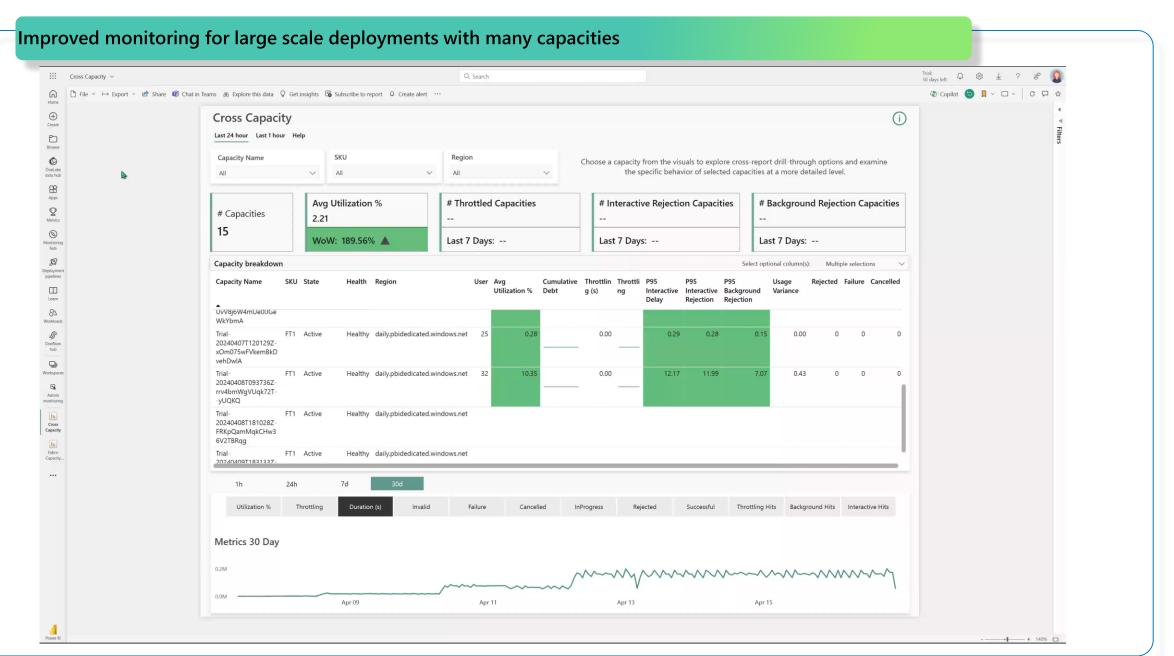

Capacities Platform Roadmap

### **Capacity Management**

### **Capacity Platform Observability improvements**

#### Admin Monitoring Integration with deprecation of template app shipping in App store

#### Federated Platform Telemetry Data Access

#### **Real-Time Intelligence**

Subscribe to high fidelity capacity metrics detailed usage data (summary, operation details and capacity state changes)

#### Aggregated data in Admin Monitoring:

Query aggregated historical data from a Lakehouse or OneLake for chargeback / capacity planning or forecasting with up to 2 years data retention out of box. North start for OneLake integration.

#### **Capacity Metrics Improvements**

Tenant Capacity Health dashboard gives you a single pane of glass to monitor your capacities.

Optimized for large customers / ISVs with domain integration.

Plan for scaleup based on preview usage.

#### **Historical Analysis**

Provides lineage and historical analyses like trends, regression, success rates, and scheduling abuse.

#### **Chargeback GA**

Analytics to help Admins and ISV's distribute a Fabric bill based on resource consumption via workspace / domain or workload

Usage

Platform data hosted in customer tenant

Operational and **Historical Analysis**

Announcing

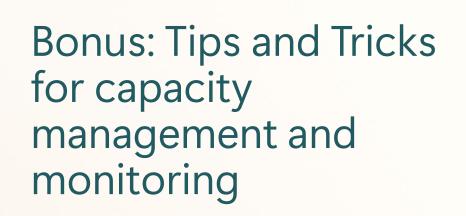

# **Fabric AI Capacities**

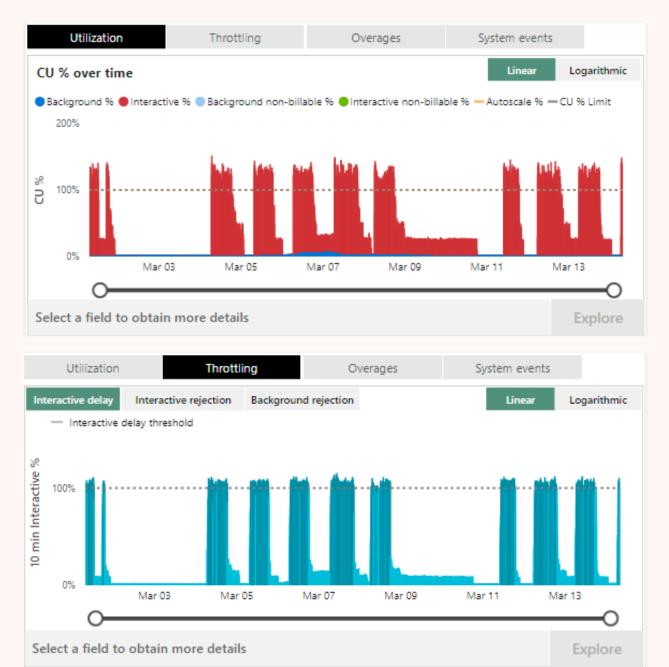

Dedicate capacity for Fabric AI workloads Enable access to Copilot across Fabric experiences

Improve capacity management & monitoring for AI

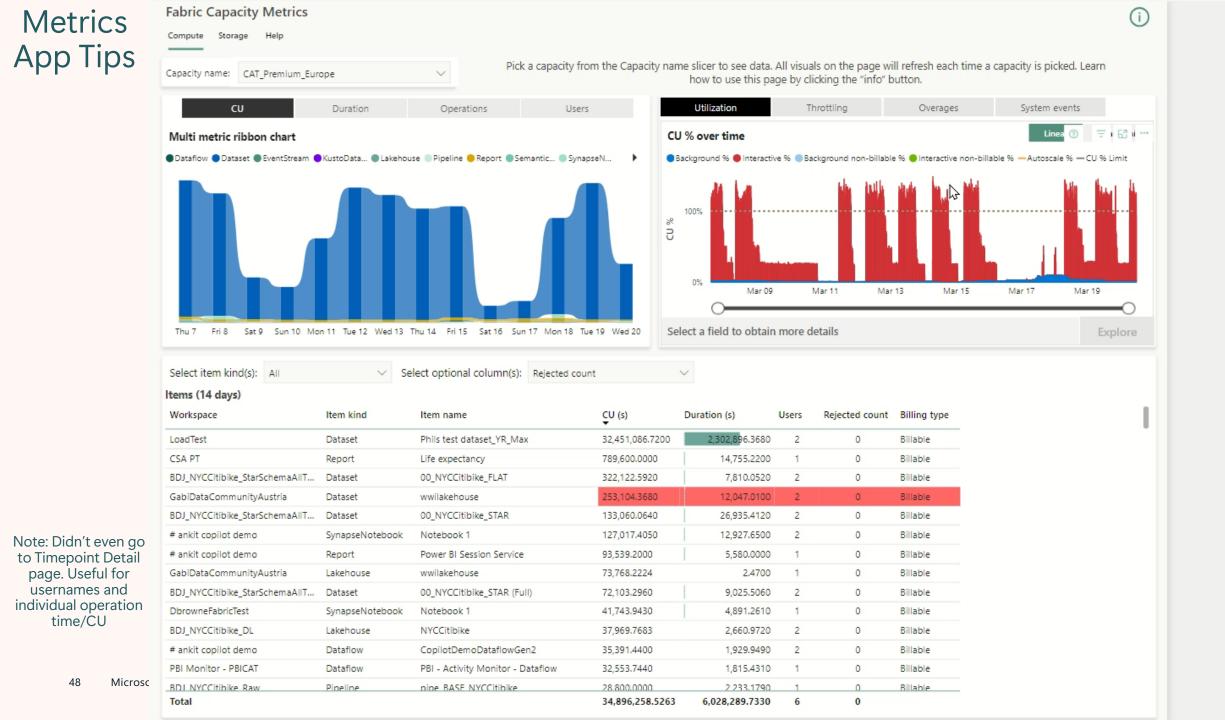

# My capacity is being throttled! What can I do?

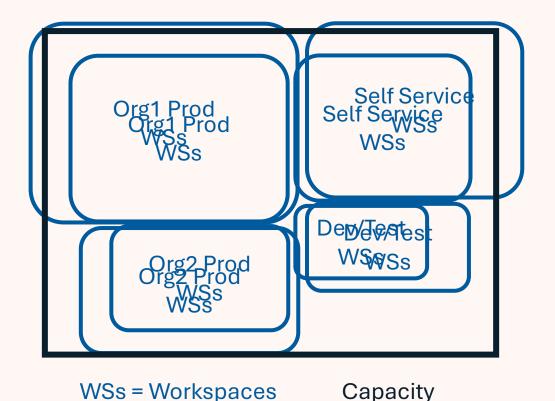

# Over 100% utilization doesn't always result in throttling

# No penalty until you hit 100% on one of the throttling tabs

Note: For F SKU, if throttled, you can pause/resume to pay now and clear the carry forward, but that is not a long-term solution

### When Capacity Units Run Out Option 1 – Optimize

Approach

• Work with content creators to follow best practices and reduce CU consumption

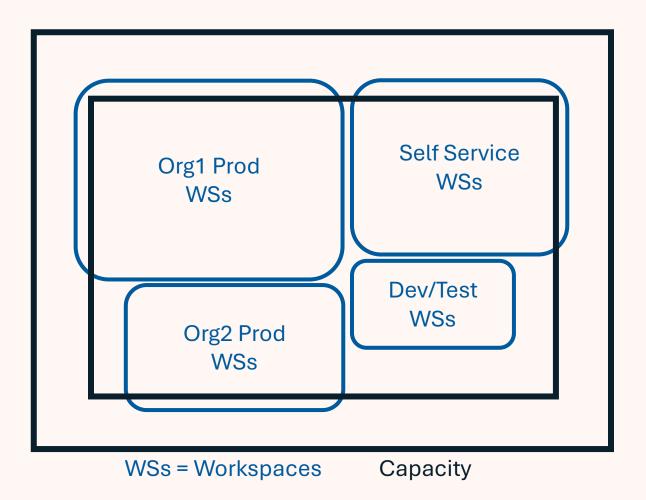

#### Pros

- Avoids increased cost
- Learning carries over to future content

#### Cons

Can be difficult/time consuming

### When Capacity Units Run Out Option 2 – Scale Up

Options to add compute

- Move to a bigger P SKU or RI F SKU
- Turn on autoscale (P SKU)
- Manual/Dynamic change size (F SKU)

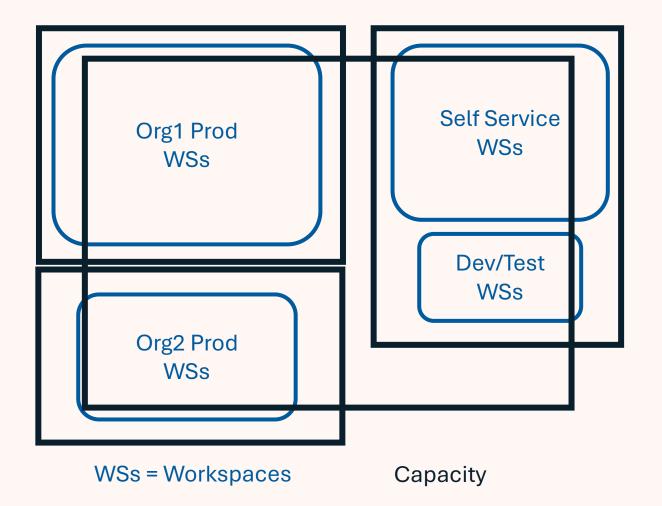

### Pros

- Add CUs for all items
- Easy

#### Cons

- Cost
- Bad actors (items with unintentionally high CU burn) can still be a problem

### When Capacity Units Run Out Option 3 – Scale Out

Options

• Create multiple smaller P or F SKUs based on organization, type of work, etc.

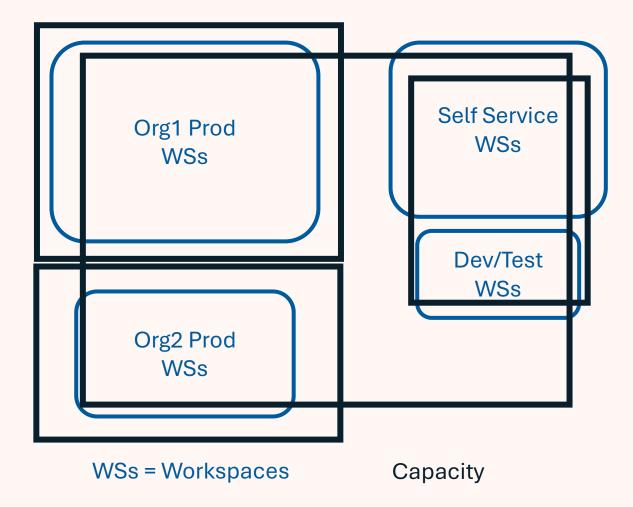

### Pros

- Easy
- Provides some isolation from bad actors (items with unintentionally high CU burn)
- Flexibility in capacity settings/governance

### Cons

- Cost
- High CU items have increased chance of throttling

### When Capacity Units Run Out Option 4 – Isolate

Approach

• Provide isolated capacity for key items built by experienced developers

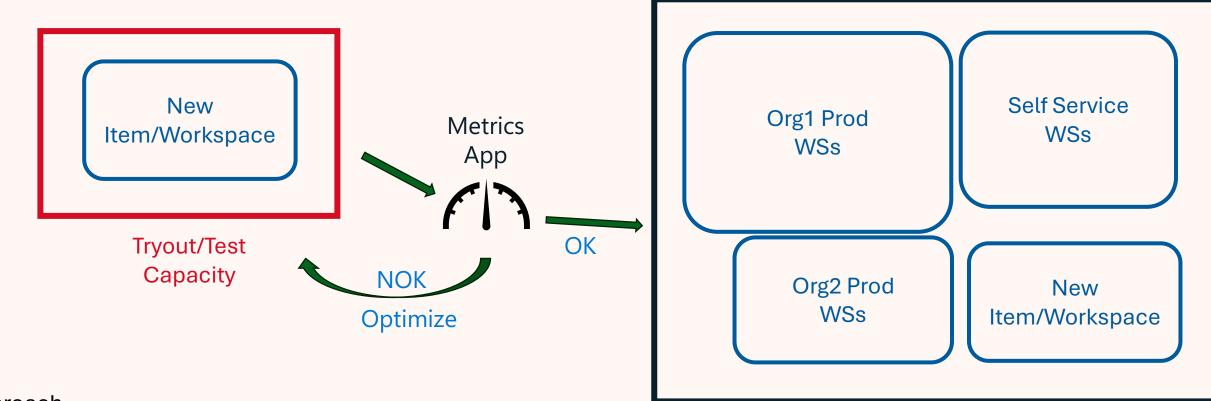

### Pros

- Easy
- Provides isolation from items built by inexperienced developers and/or rapid unplanned usage growth
- Flexibility in capacity settings/governance

### Cons

- Cost
- May lead to frustration of lower priority content developers/consumers

## Isolation Strategy #4a – Tryout Capacity

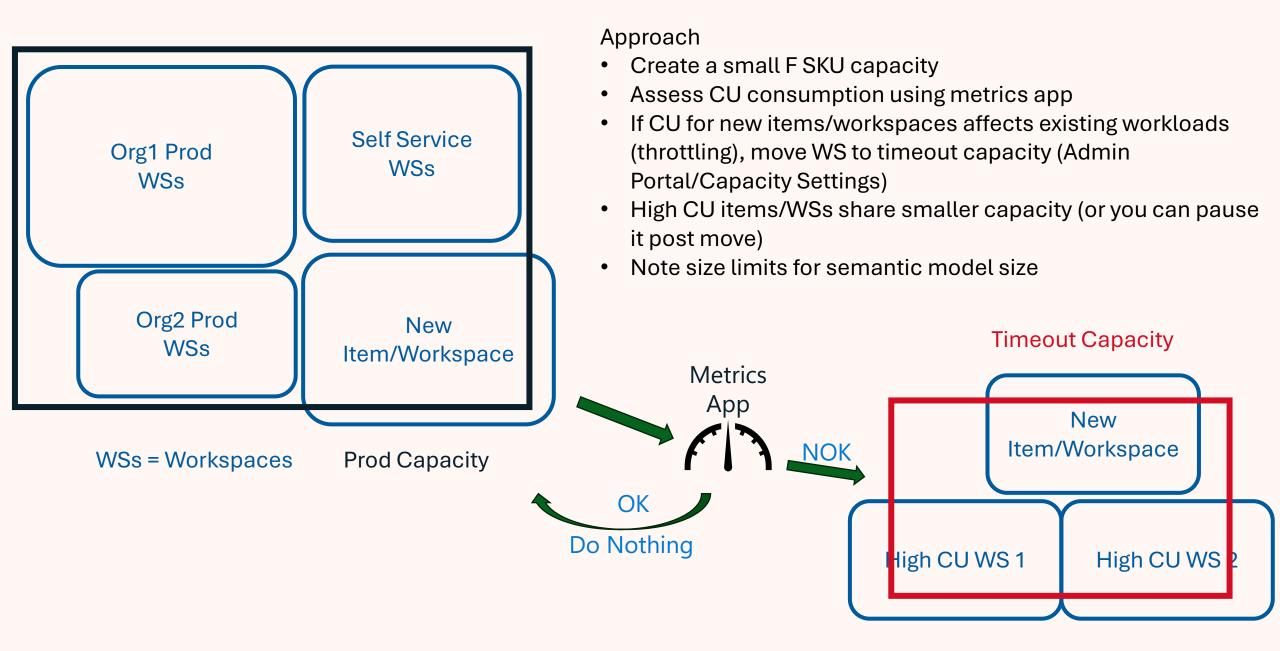

Approach

- Create a small F SKU capacity to "tryout" new workspaces/items
- Assess CU consumption using metrics app
- If acceptable, move to prod capacity
- If not, optimize
- Pause tryout capacity when not in use, if possible
- Note size limits for semantic model size

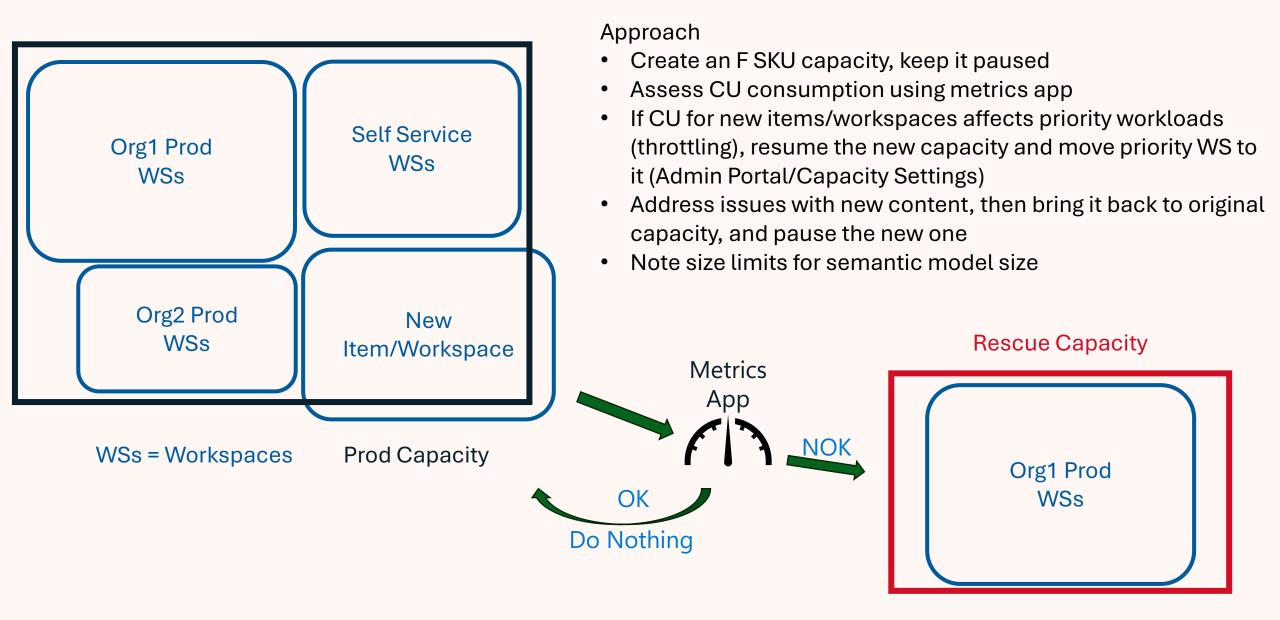

WSs = Workspaces

**Prod Capacity** 

# Isolation Strategy #4b – Timeout Capacity

## Isolation Strategy #4c – Rescue Capacity

# Recommendations for Cost/CU Savings

- Invest in education, knowledge/best practice sharing, COE, etc. for creators and consumers (proactive optimization)
- Avoid data/report sprawl (leverage certified/promoted models, OneLake shortcuts, etc.)
- Leverage a multi-capacity strategy (isolate, tryout, timeout, etc.)
- Right size your capacities and leverage F SKUs for pause/resume/resize, or reserved instances for discounts
  - Consider a combo of RI and PAYGO (for predictable surge activity)
- Choose the right tool for the job and stay up to date on Fabric feature releases
  - High concurrency mode for notebooks

# Leverage the capacity settings in the UI

- Notifications on CU overuse
- Power BI workloads settings (e.g., query limits, page refresh)

# **Custom Solutions**

- Modify the Metrics App to meet your needs
- Build a custom report off the semantic model
- Send DAX queries to the metrics app semantic model in your own solution
  - Power Automate, Notebook (SemPy), PowerShell, etc.
  - Get throttling % values (Interactive Delay, Interactive Rejection, and/or Background Rejection)
  - Latest values and/or trends over time
  - Best for summarized data only (e.g., hour, day)

# Collect data from multiple capacities and store it long term

```
# Get max date from current delta table (to avoid loading duplicate days)
9

# Most Common Capacity Issues (Power BI)

Bad Practice	<b>Recommendations/Typical Resolution</b>
Model issues (M:M, bi-di, snowflake, etc.) and/or inefficient DAX	Follow best practices (e.g., BPA), star schema
Too many visuals	Multi card, small multiples, Deneb, PowerPoint background, etc.
Big single visual (i.e., matrix with lots of rows, columns, and/or measures)	Improve report design (e.g., drillthrough, apply all Slicers, report page tooltip), field parameters, calc group guardrails, etc.
Complex RLS	Remodel to enable simple filter like Table[Email] = USERPRINCIPALNAME()
Very high concurrency	Optimize reports, DAX, etc. (big multiplier) Consider QSO, data subsets
Direct Query	Switch to import or Direct Lake, if possible. Aggregations, hybrid tables, etc.
Analyze in Excel	Automate downstream analytics with a Power BI report instead, subscriptions, DAX connected table, slicers/measures first, etc.
Excessive refresh	Don't "break the fold", incremental refresh, reduce frequency, optimize M code

### Save Those CUs – Getting Data Into Excel

### Connected Table

#### Key Takeaways

- How you build it matters
  - Filters & measures first!
- This shows durations but it's CU that matters (test your use cases/models)
- Opt for DAX Connected Tables
  - Create pivot table from that, if needed
